

2016-2017 线代 (理工) A 卷 参考解答

一. 填空题 (3×6=18)

1. 0 2. 1 3. -12
4. 14 5. $e > 9$ 6. $\begin{bmatrix} 2 & -1 \\ -1 & 1 \end{bmatrix}$

二. 解答题 (共 66 分)

1. (10 分)

$$|A| = \begin{vmatrix} 1 & 2 & 3 & 4 \\ 5 & 0 & 6 & 0 \\ 7 & 8 & 9 & 10 \\ 11 & 0 & 12 & 0 \end{vmatrix} = - \begin{vmatrix} 1 & 2 & 3 & 4 \\ 7 & 8 & 9 & 10 \\ 5 & 0 & 6 & 0 \\ 11 & 0 & 12 & 0 \end{vmatrix} = \begin{vmatrix} 4 & 2 & 3 & 1 \\ 10 & 8 & 9 & 7 \\ 0 & 0 & 6 & 5 \\ 0 & 0 & 12 & 11 \end{vmatrix}$$

$$= \begin{vmatrix} 4 & 2 \\ 10 & 8 \end{vmatrix} + \begin{vmatrix} 6 & 5 \\ 12 & 11 \end{vmatrix} = (4 \times 8 - 2 \times 10) + (6 \times 11 - 12 \times 5) = 72$$

2. (10 分)

$$\begin{bmatrix} 1 & 5 & 9 & 13 \\ 2 & 6 & 10 & 14 \\ 3 & 7 & 11 & 15 \\ 4 & 8 & 12 & 20 \end{bmatrix} \xrightarrow{\text{初等行变换}} \begin{bmatrix} 1 & 5 & 9 & 13 \\ 0 & -4 & -8 & -12 \\ 0 & 0 & 0 & 4 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$秩(A) = 秩(J_1, J_2, J_3, J_4) = 3$$

$$\text{极大元组} = J_1, J_2, J_4$$

$$\text{或 } J_1, J_3, J_4$$

$$\text{或 } J_2, J_3, J_4$$

第3页

3. (10 分) $\begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix}^{-1} = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix}$

$$\begin{bmatrix} 1 & 1 & 1 & 1 & 0 & 0 \\ 1 & 2 & 3 & 0 & 1 & 0 \\ 2 & -1 & -5 & 0 & 0 & 1 \end{bmatrix} \xrightarrow{\text{初等}} \begin{bmatrix} 1 & 0 & 0 & 7 & -4 & -1 \\ 0 & 1 & 0 & -1 & 7 & 2 \\ 0 & 0 & 1 & 5 & -3 & -1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 2 & -1 & -5 \end{bmatrix} \times \begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 3 \end{bmatrix}$$

$$X = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 2 & -1 & -5 \end{bmatrix}^{-1} \begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 3 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix}^{-1} = \begin{bmatrix} 10 & -8 \\ -15 & 13 \\ 7 & -6 \end{bmatrix}$$

4. (12 分)

$$[A \mid \vec{b}] = \begin{bmatrix} 1 & 1 & 1 & 1 & 1 \\ 2 & 3 & 4 & 5 & 6 \\ 4 & 5 & 6 & a & b \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 2 & 3 & 4 \\ 0 & 0 & 0 & a-7 & b-8 \end{bmatrix}$$

(1) 唯一解的条件为 $r_A = r_{\tilde{A}} = n$ $n=4$

但 $r_A \leq 3$, $r_{\tilde{A}} \leq 3$ 故不可能有唯一解

当 $r_A \neq r_{\tilde{A}}$ 即 $a=7$, $b \neq 8$ 时无解

(2) ① 当 $a=7$, $b=8$ 时 $r_A = r_{\tilde{A}} = 2 < n=4$ 无穷多解

$$\text{特解 } x_0 = \begin{pmatrix} -3 \\ 4 \\ 0 \\ 0 \end{pmatrix} \quad \text{基系 } x_1 = \begin{pmatrix} 1 \\ -2 \\ 1 \\ 0 \end{pmatrix} \quad x_2 = \begin{pmatrix} 2 \\ -3 \\ 0 \\ 1 \end{pmatrix}$$

$$\text{解集 } \{ x = x_0 + k_1 x_1 + k_2 x_2, k_1, k_2 \text{ 任意实数} \}$$

(装订线内请勿答题)

5 (12分) (1)

$$A = \begin{bmatrix} 1 & -\frac{1}{2} & -\frac{1}{2} \\ -\frac{1}{2} & 1 & -\frac{1}{2} \\ -\frac{1}{2} & -\frac{1}{2} & 1 \end{bmatrix}$$

$$f = x^T A x \quad x = \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}$$

(2) 解法一: 配方法

$$f(x_1, x_2, x_3) = x_1^2 + x_2^2 + x_3^2 - x_1 x_2 - x_1 x_3 - x_2 x_3$$

$$= (x_1 - \frac{1}{2}x_2 - \frac{1}{2}x_3)^2 - \frac{1}{4}(x_2 + x_3)^2 + x_2^2 + x_3^2 - x_2 x_3$$

$$= (x_1 - \frac{1}{2}x_2 - \frac{1}{2}x_3)^2 + \frac{3}{4}x_2^2 + \frac{3}{4}x_3^2 - \frac{3}{2}x_2 x_3$$

$$= (x_1 - \frac{1}{2}x_2 - \frac{1}{2}x_3)^2 + \frac{3}{4}(x_2 - x_3)^2$$

$$\begin{cases} y_1 = x_1 - \frac{1}{2}x_2 - \frac{1}{2}x_3 \\ y_2 = \frac{\sqrt{3}}{2}(x_2 - x_3) \\ y_3 = x_3 \end{cases} \Rightarrow \begin{cases} x_1 = y_1 + \frac{\sqrt{3}}{3}y_2 + y_3 \\ x_2 = \frac{2\sqrt{3}}{3}y_2 + y_3 \\ x_3 = y_3 \end{cases}$$

$$f = y_1^2 + y_2^2 \quad (\text{规范形})$$

$$C = \begin{bmatrix} 1 & \frac{\sqrt{3}}{3} & 1 \\ 0 & \frac{2\sqrt{3}}{3} & 1 \\ 0 & 0 & 1 \end{bmatrix}$$

解法二: 先正交变换再化标准形为规范形

$$|\lambda E - A| = \begin{vmatrix} \lambda-1 & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \lambda-1 & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \lambda-1 \end{vmatrix} = \lambda(\lambda - \frac{3}{2})^2$$

$$\lambda = \frac{3}{2} \quad (\text{二重}), \quad \lambda = 0 \quad (\text{一重})$$

$$\lambda = \frac{3}{2} \text{ 时 } (\frac{3}{2}E - A)x = 0 \quad \text{基向量 } x_1 = \begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix} \quad x_2 = \begin{pmatrix} -1 \\ 0 \\ 1 \end{pmatrix}$$

$$\lambda = 0 \text{ 时 } (0E - A)x = 0 \quad \text{基向量 } x_3 = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\text{将 } x_1, x_2 \text{ 正交化 } d_1 = \begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix} \quad d_2 = \begin{pmatrix} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{pmatrix}$$

$$\text{再令 } d_1, d_2, d_3 \text{ 规范化得 } Q = \begin{bmatrix} -\frac{\sqrt{2}}{2} & -\frac{\sqrt{6}}{6} & \frac{\sqrt{3}}{3} \\ \frac{\sqrt{2}}{2} & -\frac{\sqrt{6}}{6} & \frac{\sqrt{3}}{3} \\ 0 & \frac{\sqrt{6}}{3} & \frac{\sqrt{3}}{3} \end{bmatrix}$$

$$f = \frac{x}{QZ} = \frac{3}{2}z_1^2 + \frac{3}{2}z_2^2 = y_1^2 + y_2^2 \quad (\text{规范形})$$

$$\begin{cases} y_1 = \frac{\sqrt{6}}{2}z_1 \\ y_2 = \frac{\sqrt{6}}{2}z_2 \\ y_3 = z_3 \end{cases} \Rightarrow \begin{cases} z_1 = \frac{\sqrt{6}}{3}y_1 \\ z_2 = \frac{\sqrt{6}}{3}y_2 \\ z_3 = y_3 \end{cases} \quad B = \begin{bmatrix} \frac{\sqrt{6}}{3} & & \\ & \frac{\sqrt{6}}{3} & \\ & & 1 \end{bmatrix}$$

$$f = y_1^2 + y_2^2 \quad C = QB = \begin{bmatrix} -\frac{\sqrt{3}}{3} & -\frac{1}{3} & \frac{\sqrt{3}}{3} \\ \frac{\sqrt{3}}{3} & -\frac{1}{3} & \frac{\sqrt{3}}{3} \\ 0 & \frac{2}{3} & \frac{\sqrt{3}}{3} \end{bmatrix}$$

b (12分) (1) $A = \begin{bmatrix} 0.97 & 0.05 \\ 0.03 & 0.95 \end{bmatrix}$ 2

$$x_1 = Ax_0 = \begin{bmatrix} 0.97 & 0.05 \\ 0.03 & 0.95 \end{bmatrix} \begin{pmatrix} 560 \\ 1040 \end{pmatrix} = \begin{pmatrix} 595.2 \\ 1004.8 \end{pmatrix} \quad (万)$$

(2) 解法一: $|\lambda E - A| = 0 \Rightarrow \lambda_1 = 1 \quad \lambda_2 = 0.92$ 1

$\lambda_1 = 1$ 对应的特征向量为 $x_1 = \begin{pmatrix} 5 \\ 3 \end{pmatrix}$

$\lambda_2 = 0.92$ 对应的特征向量为 $x_2 = \begin{pmatrix} 1 \\ -1 \end{pmatrix}$ 1

$x_0 = C_1 x_1 + C_2 x_2 \quad C_1 = 200 \quad C_2 = -440$

$x_n = A^n x_0 = A^n (C_1 x_1 + C_2 x_2)$

4 $= C_1 \lambda_1^n x_1 + C_2 \lambda_2^n x_2$

$= C_1 x_1 + C_2 \cdot 0.92^n x_2 \approx C_1 x_1 \quad \text{当 } n \rightarrow \infty \text{ 时}$

$C_1 x_1 = 200 \begin{pmatrix} 5 \\ 3 \end{pmatrix} = \begin{pmatrix} 1000 \\ 600 \end{pmatrix} \quad (万)$ 2

即经过若干年后, 成都市人口趋近 1000 万, 郊区 600 万

解法二: $P = \begin{bmatrix} 5 & 1 \\ 3 & -1 \end{bmatrix} \quad P^{-1}AP = \begin{bmatrix} 1 & 0 \\ 0 & 0.92 \end{bmatrix}$ 2

$A = P \begin{bmatrix} 1 & 0 \\ 0 & 0.92 \end{bmatrix} P^{-1} \quad A^n = P \begin{bmatrix} 1^n & 0 \\ 0 & 0.92^n \end{bmatrix} P^{-1}$

$A^n = \begin{bmatrix} 5 & 1 \\ 3 & -1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 0 \\ 0 & 0.92^n \end{bmatrix} \cdot \left(-\frac{1}{8}\right) \begin{bmatrix} -1 & -1 \\ -3 & 5 \end{bmatrix}$

第3页

$A^n = -\frac{1}{8} \begin{bmatrix} -5 - 3 \times 0.92^n & -5 + 5 \times 0.92^n \\ -3 + 3 \times 0.92^n & -3 - 5 \times 0.92^n \end{bmatrix}$ 3

$x_n = A^n x_0 = \begin{pmatrix} a_n \\ b_n \end{pmatrix}$

$a_n = -\frac{1}{8} [(-5 - 3 \times 0.92^n) \times 560 + (-5 + 5 \times 0.92^n) \times 1040]$

$\approx -\frac{1}{8} [-5 \times 560 - 5 \times 1040] = 1000$ 1

$b_n = -\frac{1}{8} [(-3 + 3 \times 0.92^n) \times 560 + (-3 - 5 \times 0.92^n) \times 1040]$

$\approx -\frac{1}{8} [-3 \times 560 - 5 \times 1040] = 600$ 1

$x_n \approx \begin{pmatrix} 1000 \\ 600 \end{pmatrix} \quad (万) \quad \text{当 } n \rightarrow \infty \text{ 时}$ 2

第4页

教务处制

(装订线内请勿答题)

三 证明 (8+2=16)

1 (8分) $A\eta_0 = \beta$ $A\eta_1 = A(\eta_0 + x_1) = \beta + \vec{0} = \beta$

$A\eta_2 = A(\eta_0 + x_2) = \beta + \vec{0} = \beta$

η_0, η_1, η_2 均为 $Ax = \beta$ 的解

设 $k_0\eta_0 + k_1\eta_1 + k_2\eta_2 = \vec{0}$ (1)

即 $(k_0 + k_1 + k_2)\eta_0 + k_1x_1 + k_2x_2 = \vec{0}$ (2)

用 A 左乘得 $(k_0 + k_1 + k_2)\beta = \vec{0}$

$\beta \neq \vec{0} \Rightarrow k_0 + k_1 + k_2 = 0$ (3)

故 (2) 式为 $k_1x_1 + k_2x_2 = \vec{0}$

x_1, x_2 线性无关 $\Rightarrow k_1 = k_2 = 0$

代入 (3) 有 $k_0 = 0$

故 η_0, η_1, η_2 线性无关

$\forall \eta$ 满足 $A\eta = \beta$ $A(\eta - \eta_0) = \vec{0}$

$\eta - \eta_0$ 可由 x_1, x_2 线性表示

$\eta - \eta_0 = c_1x_1 + c_2x_2$

$\eta = \eta_0 + c_1(\eta_1 - \eta_0) + c_2(\eta_2 - \eta_0)$

$= (1 - c_1 - c_2)\eta_0 + c_1\eta_1 + c_2\eta_2$

η 可由 η_0, η_1, η_2 线性表示

故 η_0, η_1, η_2 为 $Ax = \beta$ 解集的极大无关组

2 (8分) 若 λ 为 A 的特征值, 则

$\lambda^2 - 2\lambda - 3 = 0 \Rightarrow \lambda = 3$ 或 $\lambda = -1$

$\lambda^2 - 2\lambda - 3 = 0 \Rightarrow (A + E)(A - 3E) = 0$

A 不是数量矩阵 故 $A - 3E \neq 0$ $(A + E)$ 有非零解 故 $|A + E| = 0$

-1 为 A 的特征值, 同理 3 亦为 A 的特征值

A 属于 $\lambda = -1$ 的线性无关特征向量个数为

$n - R(-E - A) = n - R(E + A)$

A 属于 $\lambda = 3$ 的线性无关特征向量个数为

$n - R(3E - A)$

又 $R(3E - A) + R(E + A) \geq R(3E - A + E + A) = n$

$(E + A)(3E - A) = 0 \Rightarrow R(3E - A) + R(E + A) \leq n$

故 $R(3E - A) + R(E + A) = n$

A 的线性无关特征向量个数为

$n - R(E + A) + n - R(3E - A)$

$= 2n - [R(E + A) + R(3E - A)] = 2n - n = n$

故 A 可对角化

4 (2) ② 当 $a \neq 7$ 时 $r_A = r_B = 3 < n = 4$ 无穷解

$$\begin{cases} x_1 + x_2 + x_3 + x_4 = 1 \\ x_2 + 2x_3 + 3x_4 = 4 \\ (a-7)x_4 = b-8 \end{cases}$$

无穷解 $x_4 = \frac{b-8}{a-7}$ $\Rightarrow x_3 = 0$

$$x_2 = 4 - 3 \frac{b-8}{a-7} = \frac{4a-3b-4}{a-7}$$

$$x_1 = 1 - \frac{4a-3b-4}{a-7} - \frac{b-8}{a-7} = \frac{-3a+2b+5}{a-7}$$

$$x_0 = \frac{1}{a-7} \begin{pmatrix} 2b-3a+5 \\ 4a-3b-4 \\ 0 \\ b-8 \end{pmatrix}$$

基向量 $\alpha_1 = \begin{pmatrix} 1 \\ -2 \\ 1 \\ 0 \end{pmatrix}$

4

解集 $\{ x_0 + k\alpha_1, k \text{ 为任意常数} \}$
